

AI Agent Prompting Template

None

[ROLE]

- You are the [Name of Agent / Role].
- Your main responsibility is to [Primary Objective].

[CONTEXT]

- System environment: [Briefly describe the multi-agent environment].
- Known details: [Facts, references, previous conversation context].

[TASK]

- Goal: [Specific outcome you want].
- Constraints: [Time limit, length limit, etc.].
- Style: [Tone, formatting guidelines].
- Output format: [Plain text, HTML, JSON, etc.].

[COLLABORATION]

- Other agents: [Who they are, what they provide].
- Interaction: [How and when this agent should interact with them].

[EXAMPLES]

- Good response example: [...]
- Bad response example: [...]

[FINAL REQUIREMENTS]

- QA checks: [Spelling, grammar, factual accuracy].
- Ethical guidelines: [Allowed/Disallowed content].
- Error handling: [Instructions if something goes wrong].

How it works....

1. Role Definition

- **Role/Persona:** Explain what this agent is supposed to be or act as (e.g., "You are a financial advisor," or "You are a marketing specialist").
- **Expertise Level:** Specify the level of expertise expected (e.g., "Expert in legal matters," "Beginner-friendly instructor").
- **Primary Objectives:** Summarize what the agent does in the multi-agent system. For instance, is it the summarizer, the code generator, the fact-checker, or something else?

Example:

Role: You are the "Content Fact-Checker" AI, responsible for verifying the factual accuracy of texts and providing corrections or supporting evidence.

2. Context and Background

- **System Context:** Provide the larger setting or scenario that the multi-agent system is operating in (e.g., "A team of AIs collaborating to write blog posts for a tech website").
- **Shared Knowledge:** State any relevant facts, constraints, or previously known information.
- **Relevant Documents/Resources:** Indicate which resources are available for referencing (e.g., knowledge bases, FAQs, user manuals).

Example:

Context: This multi-agent system is designed to create an in-depth user guide for a new software product. Other agents will contribute research, product details, and marketing best practices.

3. Task Explanation / Goal

- **Core Task:** Clearly spell out the objective: "Write a step-by-step tutorial," "Generate marketing slogans," "Verify factual data in the product description," etc.
- **Input Details:** Clarify if there is specific user input or data that must be processed.
- **Output Format:** Outline precisely how you want the response formatted (bullet points, JSON, full paragraphs, etc.).

Example:

Task: Given the product specifications below, generate a 300-word FAQ article in plain English. Keep it accurate and user-friendly.

4. Constraints and Instructions

- Length or Size: Maximum or minimum character or token count.
- Tone or Style: Formal, casual, academic, comedic, etc.
- Do's and Don'ts: Any rules to follow or things to avoid (e.g., "Do not include speculation," "Always include references," "Avoid copyrighted text," etc.).
- Time or Resource Limits: If needed for real-time systems, mention performance constraints.

Example:

Constraints:

1. Keep responses under 500 words.
 2. Maintain a friendly, approachable tone.
 3. If uncertain about any facts, ask for clarification from the "Research" agent.
-

5. Collaboration and Interaction Protocol

- Other Agents' Roles: Summarize what the other agents do, so this agent knows where it fits in the workflow.
- Message Passing: Indicate whether this agent can or should request additional data from the other agents (e.g., "Query the 'Research Agent' for references," "Ask the 'Design Agent' for visuals").
- Sequence of Turns: In a multi-agent environment, specify how and when this agent should speak or remain silent.

Example:

Collaboration:

- The "Research Agent" can provide product data.
- The "Design Agent" can contribute visuals or layout ideas.

- You (the “Content Fact-Checker”) should correct any inaccuracies in the final text and provide reliable sources if available.
-

6. Example Prompts and Responses

- **Templates:** Show a sample conversation that demonstrates how to respond.
- **Positive/Negative Examples:** Provide examples of good vs. bad outputs, so the agent knows what to aim for or avoid.

Example:

Good Example:

- **User:** “Please summarize the key benefits of the product.”
- **Agent:** “The top three benefits are X, Y, and Z (reference data source A). They help users save time, reduce costs, and increase productivity.”

Bad Example:

- **Agent:** “Just buy it; it’s the best.” (No detail or references)
-

7. Formatting and Output Specifications

- **Metadata:** If multiple AI outputs will be combined, you might need to return metadata (e.g., timestamps, versioning info, or references used).
- **Structured Output:** If the system requires JSON or a specific markup, specify that.
- **Error Handling:** Indicate what the agent should do if an error occurs or a query can’t be answered.

Example:

Output Format:

- Return your final answer as valid JSON with the keys: “summary”, “references”.
 - If no valid references are found, return an empty list for “references” and note “No additional references.”
-
