AI Operating Systems

Cheat sheet

Step 1: Secure the Call

Provide value upfront by offering a **free assessment** to determine if an AI operating system will be beneficial for their business. This positions you as a consultant rather than a vendor and gets you in the door.

- 🎁 Lead with free value, not a sales pitch
- 🧠 Position yourself as the expert advisor
- 📞 Make the assessment irresistible to get them on the call

Step 2: Identify the Core Constraining Factor

Clarify that while AI can do anything, success comes from being married to the numbers that matter most. Ask the critical question: **"What is the one number that, if we move it, your business moves forward?"** This could be delivery times, sales conversion, customer retention, or operational efficiency. Focus on significance over random automations.

- 📊 Find THE number that drives their business forward
- ⚡ Focus on high-impact areas, not random automations
- 🎯 Ask directly: "What's your biggest bottleneck right now?"

Step 3: Map the Ideal Customer Journey

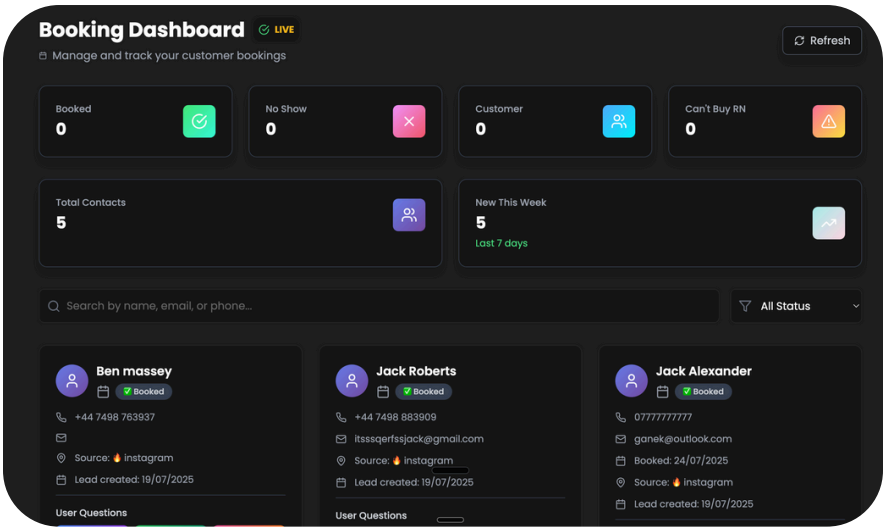
Define the **start and end points** of their most important process. For example: "Someone books a call" (start) → "They buy" (end). Then outline the **dream customer journey** - what would the perfect version look like? This ensures you're not automating broken processes but creating optimal workflows.

- 🚀 Identify clear start point → end point of their key process
- ✨ Design the "dream scenario" customer experience
- 🚫 Don't automate broken processes - fix them first

Step 4: Identify Key Data Interfaces and Central Truth

Catalog all the **data touchpoints** in their business: SMS, email, phone calls, meetings, CRM interactions, etc. Determine their **central source of truth** (usually a CRM or similar system). This mapping reveals how data flows through their organization and where AI can best integrate.

- 📱 Map ALL touchpoints: SMS, email, calls, meetings, etc.
- 🏛️ Find their central source of truth (usually CRM)
- 🔄 Understand how data flows through their business



Step 5: Design the AI Operating System Blueprint

Based on the previous steps, **refine and create the perfect journey** that runs on autopilot. Present them with a **clear roadmap** showing exactly how the AI operating system will be built around their core constraints and data flows. Emphasize that you're building complete systems that deliver results, not just individual automations - because people replace automations, but they rely on systems.

- 🤖 Create the complete autopilot system blueprint
- 📋 Give them a crystal-clear implementation roadmap
- 🏆 Emphasize: You build SYSTEMS, not just automations
