

Prompts

1) Consistent Naming conventions

SOCIAL MEDIA DATA INTEGRATION APP - BUILD SPECIFICATION

OBJECTIVE:

Create a minimal viable application that successfully fetches and displays data from LinkedIn, YouTube, and Instagram stored in Airtable, with a focus on data integrity before design implementation.

DATABASE INFORMATION:

- Airtable Base URL:

<https://airtable.com/appENPbhagMrHGXRQ/tblSLOpMd4RltiPcn/viwOe3AK9fvDHnJ2I>

- Platform Data: LinkedIn, YouTube, Instagram (stored in separate tabs with identical schemas)

- API Key: [To be provided separately]

PHASE 1: DATA RETRIEVAL & DISPLAY

1. INITIAL SETUP

- Create a new project in loveable.dev
- Configure basic environment variables storage for the Airtable API key
- Set up a simple component structure with three separate sections: LinkedIn, YouTube, Instagram

2. AIRTABLE CONNECTION LAYER

- Create a dedicated API service module for Airtable connectivity
- Implement standardized error handling and logging for all API calls
- Build separate functions for each platform that follow identical patterns:
 - * getLinkedInData()
 - * getYouTubeData()
 - * getInstagramData()
- Include detailed console logging for debugging API responses

3. DATA FETCHING IMPLEMENTATION

- For each platform, implement step-by-step data retrieval:
 - a. Fetch data with appropriate table/view parameters
 - b. Log raw response for debugging
 - c. Transform data into consistent format

- d. Store in local state
- Add loading states and error handling for each platform
- Include manual refresh functionality

4. MINIMAL DISPLAY COMPONENTS

- Create a simple tabbed interface with platform names
- For each platform, display data in a basic table format showing:
 - * Post URL
 - * Engagement metrics
 - * Timestamp/date posted
- Include visual indicators for successful/failed data loading
- Add toggleable raw data view for debugging

5. DATA VALIDATION & TESTING

- Add data validation checks to confirm expected fields exist
- Create a diagnostic panel showing connection status for each platform
- Implement a data comparison view to verify schema consistency

DELIVERABLES:

1. Functional app displaying all three data sources in tabular format
2. Debug panel showing API response details and errors
3. Data refresh controls and connection status indicators

TECHNICAL SPECIFICATIONS:

- Use functional components with hooks for state management
- Implement Airtable API using their official JavaScript client
- Avoid complex UI libraries initially - focus on function over form
- Add extensive console logging for transparency

SUCCESS CRITERIA:

- All three platforms' data is successfully retrieved and displayed
- No console errors related to data fetching or parsing
- Data refresh functionality works consistently
- Data structure from all platforms is validated for consistency
